

Name _____

CPADS Assignment #1

1. Open Pycharm making sure to select the Python 3.5 interpreter. Create a new project named **CS100-Assignment1**. Right click on **CS100-Assignment1** in the left sidebar and select **New->Python File**. Name the file **drawSquareCompute**. Type the following code **exactly** as shown copying the **drawSquareFromCenter()** function code from **CS100-Lab2**

```
import turtle

def drawSquareFromCenter(turtle,x):...

def main():
    # Create turtle
    bob = turtle.Turtle()

    # Get user input
    size1 = int(input("Enter size for first square: "))
    size2 = int(input("Enter size for second square: "))
    size3 = int(input("Enter size for third square: "))
    size4 = int(input("Enter size for fourth square: "))

    # Draw graphics
    # TODO: Move to center of first square
    drawSquareFromCenter(bob,size1)

    # TODO: Move to center of second square
    drawSquareFromCenter(bob,size2)

    # TODO: Move to center of third square
    drawSquareFromCenter(bob,size3)

    # TODO: Move to center of fourth square
    drawSquareFromCenter(bob,size4)

    # Press any key to exit
    input()

main()
```

The program should prompt the user to enter four sizes for the squares and simply draw all of them concentrically about the origin.

Name _____

2. Complete the program by adding code in the sections marked **TODO** that computes movement to the centers of each square **USING** the variables **size1**, **size2**, **size3**, **size4**. You **MUST** move in the following manners:
 1. **Square 1:** Move to the center using a forward, right turn, forward procedure returning back to the origin after drawing the square
 2. **Square 2:** Declare a variable for the direct distance to the center, turn 45 degrees, move forward, draw the square, and then move back to the origin.
 3. **Square 3:** Declare two variables **x** and **y** and compute the center coordinates, use the **setposition(x,y)** turtle command to move, and then draw the square. **DO NOT** return to the origin.
 4. **Square 4:** Declare two variables **dx** and **dy** and compute the x and y distances from the center of the third square, use forward and turn commands to move, draw the square, and then move back to the origin.

Hint: USE A STRATEGY TO FIGURE OUT THE PROPER COMPUTATIONS!
